

ABSTRACT

A precision mask for deposition is provided that includes a first brace having a plurality of sections placed in parallel to each other at given intervals. The first brace forms portions that define a plurality of first openings. The precision mask for deposition also includes at least one second brace that is placed on the first brace so as to intersect with the first brace. The second brace forms portions that define a plurality of second openings. The second brace is joined to the first brace at a point where the second brace intersects with the first brace.
